

<https://github.com/Vexa-ai/vexa>

Here is a breakdown of what it does and why it is useful,

1. What does it actually do?

- **Real-Time Note Taking (Transcription):** It can join a call, listen to the conversation, and generate a live, second-by-second text transcript of exactly who is saying what.
- **Interactive Bots:** Unlike bots that just silently take notes, Vexa bots can actually participate. They can be programmed to speak out loud, send messages in the meeting chat, or even share their screen.
- **AI Integration:** It acts as a bridge between your video calls and advanced AI brains (like Claude or ChatGPT). You can send an AI agent into a meeting to listen to the context and help answer questions on the fly.

2. Why use this instead of Otter.ai or other paid tools?

- **Total Privacy (Data Sovereignty):** This is the biggest selling point. When you use a service like Otter.ai, your private meeting audio is sent to their corporate servers. Vexa allows you to "self-host" it, meaning you can run the entire program on your own private computers. If you are a hospital, a bank, or

just a privacy-conscious company, your highly sensitive meeting data never leaves your building.

- **Cost:** Paid tools often charge a monthly fee per employee (e.g., \$20/month per person). Because Vexa is free and open-source, companies just pay for their own computer servers, which can be drastically cheaper for large teams.
- **You can build your own tools:** It is designed for developers. If a software developer wants to build a brand new app that summarizes meetings, they don't have to figure out the incredibly complicated process of getting a bot into a Zoom call—they just use Vexa as the foundation and build their app on top of it.

In short: Vexa is a building block that allows developers and privacy-focused companies to create their own secure, highly capable AI meeting assistants without relying on expensive, third-party subscriptions.

<https://github.com/screenappai/meeting-bot>

1. What is its main purpose?

Its entire job is to automatically jump into a meeting, silently record the video and audio, save that recording, and then notify you when the video file is ready. That's it. It doesn't try to transcribe the text, it doesn't talk, and it doesn't plug directly into AI chatbots on the fly.

2. What are its main features?

- **Universal API:** It gives developers one single, easy way to send a bot to *any* of the major platforms (Zoom, Meet, or Teams) without having to write different code for each one.
- **Automated Recording:** It joins the call as a silent participant (like a guest), records the video/audio, and can automatically upload the finished video file to a cloud storage drive (like Amazon S3).
- **One Job at a Time:** To keep things from crashing or freezing, each bot is designed to handle exactly one meeting at a time. If you need to record 10 meetings at once, you just spin up 10 bots.
- **Notification System:** Once a meeting is done and the video is saved, it can automatically send a "ping" (webhook) to another app or database to say, "Hey,

the recording from the 2:00 PM meeting is ready to view!"

3. Why would someone use this?

If a developer or a company wants to build a simple app that just captures meeting videos for later (maybe for archiving, training, or putting the video through their own separate AI software later), they would use this. It is totally free, highly reliable, and very easy to set up compared to heavier, more complex systems.

In short: If Vexa is a Swiss Army Knife for meetings (doing transcripts, AI chatting, screen sharing, etc.), this Meeting Bot is a highly reliable, single-purpose pocket knife that does exactly one thing very well: it silently records your meetings.

Thinking

- I'm pulling together Katherine + her company first, then turning it into what matters for the call: who she is, what they actually do, where the fit is strong, and what to ask before any next step.

- ⊕ Searching for Katherine environmental remediation waste management company nationwide EPA compliance

www.hazardouswasteexperts.com

kpa.io

cleanmanagement.com

www.uswonline.com

www.epa.gov

- Not specific enough yet. Let me search more precisely for Katherine and her company using context clues from her

Thinking...

Katherine represents a nationwide environmental services company on the supply side of this market. Based on her reply, her company runs the full stack: hazardous and non-hazardous waste management, compliance-driven disposal, recycling, and sustainability programs, plus environmental remediation. That service profile maps closely to the kind of provider that gets called in when a company receives an EPA enforcement action — RCRA corrective action, CERCLA-related cleanup obligations, or consent decree requirements — and suddenly needs a credentialed contractor fast. She is not a buyer in distress. She is a specialist provider who wants a cleaner, faster path to companies that are already under enforcement pressure and actively scoping remediation support.

Her questions in the reply are telling. She asked about geography, type of enforcement action, and whether opportunities are direct or brokered. The casual questions — those are intake questions — someone who has been burned by brokers wasting referrals before. She wants to know if this is real and whether it maps to where she is.

Let her answers tell you how to frame paid access. The close isn't a hard sell — it's a natural next step once she confirms the profile fits and she understands that the flow doesn't go to unvetted providers for free.

OPEN WITH

"Hey Katherine, quick one, I'll keep it tight. So, this is a bit of a cold reach even though you booked — honestly, I wasn't sure how much context came through in the note. I'm not a remediation operator myself, I mean, I don't run cleanups or manage waste disposal — but I sit close to a specific category of demand, companies moving through EPA enforcement, and before I pointed any of that toward someone on the services side, I just wanted to get a feel — is your team typically looking to get in front of more of those enforcement-driven situations, or is that already a strong existing pipeline?"

BETWEEN US

SAY

Yeah, that makes sense. Most groups like yours aren't purely remediation shops — you've got waste, disposal, compliance, recycling, all of that sitting around it. The reason I'm focused on the enforcement side is because those situations usually create a more urgent buying event than normal environmental work.

When those EPA-driven situations do come across your desk, what kind are actually worth your team's time — cleanup/remediation, waste disposal, compliance support, or the full cycle
